

Developer Series Evolution

Developer Series 1 — Prototype architecture and stack

Series 1 established the universal prototype distribution and technical baseline.

Distribution

One URL/QR opens an adaptive PWA across iOS, Android, Windows and macOS. It is one platform with responsive/adaptive presentation rather than unrelated device-specific products.

Locked stack direction

- TypeScript
- Next.js + React
- Tailwind + Radix/shadcn-derived Vossie component system
- TypeScript modular monolith
- PostgreSQL
- Supabase prototype foundation
- Drizzle + explicit SQL where needed
- Zod validation
- Vossie RBAC/capabilities + server checks + RLS
- Supabase Realtime
- Vitest + Playwright
- GitHub monorepo
- pnpm + Turborepo
- GitHub Actions
- Vercel + Supabase prototype deployment

Candidate/optional layers

- SwiftUI for future iOS-native expansion where background location/camera/native behaviour requires it.
- Clerk considered as an auth candidate behind an identity-provider boundary.
- Provider adapters for payments, maps, notifications and media.

Developer Series 2 — Figma and motion production

Series 2 made Figma the UI/UX source of truth and defined:

- variables/tokens,
- primitives,
- reusable components,
- role-specific patterns,
- responsive states,
- full 177-screen assembly,
- Figma MCP as an accelerator where access permits,
- Motion.dev/CSS as the runtime motion layer,
- Motion.so as optional exported-media generation only.

The rule was to build a design system first, not generate 177 disconnected mockups.

Developer Series 3 — Agentic engineering workflow

Series 3 defined the multi-agent SDLC across ChatGPT, Cursor, VS Code, GitHub and CI/CD.

ChatGPT

Architect/coordination layer.

Cursor lead

Atlas — build lead and task coordinator.

Cursor specialists include: - Pixel — frontend/UI - Forge — backend - Schema — data/database - Market — market-place/domain flows - Relay — logistics/realtime - Bridge — integrations - Kinetic — motion/UI behaviour - Probe — implementation testing - Scribe — documentation

Reliability: - Guardian — workflow completeness/audit - Medic — build/runtime/debug recovery

VS Code lead

Sentinel — independent verification/control lead.

Review agents include: - Lens — code review - Aegis — security - Vector — QA/E2E/release smoke - Pulse — performance/accessibility - Vault — data/migrations/RLS - Harbor — Git/release/merge gates

Reliability: - Watchtower — verifies required gates actually ran - Resolver — root-cause analysis and recovery routing

Workflow

Requirement → Feature Contract → Atlas plan → isolated branch/worktree → specialists build → Probe checks → Guardian audit → Medic runtime verification → commits/PR → Sentinel review → Watchtower gate audit → Resolver recovery if needed → Harbor merge gate → CI/CD deploy → post-deploy smoke → status/evidence written to GitHub/.vossie.

Developer Series 4 — Cinematic pitch production

Series 4 defined an Apple-style, motion-led pitch system.

Act I

Approximately four minutes of cinematic origin/team story.

Act II

Approximately 15–20 minutes of Danny-led product demonstration with cueable sections instead of one fixed long movie.

Motion identity

The Vossie dot is the recurring transition and motion signature.

Production system

Figma/prototype UI is authoritative for product visuals. After Effects is the primary cinematic composition tool where available. Illustrator handles vector assets where useful. Motion sequences are modular, not one giant timeline.

Work handoff

A dedicated prompt tells ChatGPT Work to audit the Brand Identity, Figma, prototype and Series 4 spec before building production assets.
