

Recovery Limits and Archive Integrity

What this archive contains

This archive contains the complete **recoverable Vossie project knowledge** available from:

- current conversation context,
- recovered prior-conversation context,
- saved project artifacts,
- platform strategy revisions,
- UI/UX files,
- developer series,
- business/marketing documents,
- and the latest confirmed decisions.

Important distinction

This knowledge base is intended to transfer the project accurately to a fresh account. It is not a guaranteed verbatim export of every historical ChatGPT message ever sent across every separate chat, because chat transcripts that are not present in current context or saved as artifacts cannot be reconstructed word-for-word without inventing text.

Where exact old wording was unavailable, the archive preserves the decision, rationale, workflow and artifact that resulted from it.

What must never be invented during migration

- Eduvos institutional approval.
- Live Microsoft/Entra integration access.
- Live payment credentials.
- Government identity verification access.
- Live logistics-provider contracts.
- Production readiness.
- Features not present in the approved product decisions.

How to use the archive safely

For a fresh ChatGPT account, upload the `00_START_HERE` files first. Then upload the source PDFs/PPTX/Figma links. Tell the new account to treat the knowledge base as context and to ask only when there is a real unresolved conflict, not to redesign the product from scratch.
