

Project Context

Project Context

Origin

Vossie began as an Eduvos student marketplace concept and evolved through the EduHackers research/build process into a much broader campus-commerce operating system.

The project combines:

- verified student identity,
- local campus buying and selling,
- student courier participation,
- campus hub custody and collection,
- cross-campus parcel movement,
- seller analytics and incubation support,
- operations/admin tooling,
- payments, disputes and auditability,
- short-form commerce discovery through Marketplace Reels,
- buyer-side Requests when a needed product/service is not listed.

Core differentiation

The strongest thesis is not “marketplace for students.” The stronger combination is:

verified campus identity + multi-role student participation + campus logistics/custody + cross-campus transfers + operations tooling + demand intelligence for student entrepreneurship.

Current project state

The work now exists across strategy PDFs, a 177-screen UI/UX atlas, developer guides, motion specifications, business research, marketing materials and a cinematic pitch blueprint.

The project should be treated as a system with a canonical hierarchy of decisions. Older prototypes and older PDFs are useful references, but newer confirmed decisions override them.

Prototype philosophy

The demo should feel real and interactive:

- real state transitions inside the prototype,
- simulated/sandbox external integrations,
- real cross-device responsive behaviour,
- no false claims of live Eduvos, payment-provider or courier-provider connectivity,
- deterministic demo data and reset paths,
- polished motion and microinteractions.

Zero-budget principle

Use free tiers, local simulation and open/free tools for the prototype. Keep all provider-specific integrations behind adapters so the implementation can switch later without rebuilding the product domain.
