

# Cross-Campus Transfers

## Cross-Campus Transfers

### Hybrid model

Cross-campus is not a single student driving across provinces for every order.

Preferred model:

- campus hub network for pooled routes,
- third-party courier fallback for low-volume/long-distance cases.

### Routing

For hub-to-hub movement, route through the **nearest viable** campuses, not merely nearest by straight-line distance. Viability includes route direction, schedule, capacity and operational availability.

Example concept:

Cape Town-area campus → next viable campus hub(s) → destination region/campus → local fulfilment.

### User experience

Buyer sees one shipment and one tracking timeline, not many fragmented orders.

### Operational model

Each leg has a manifest and custody scans. Intermediate hubs reconcile packages before forwarding.

### Third-party fallback

If hub transfer is not economical (e.g. one parcel), offer approved external logistics such as parcel-point/direct courier where available. Third-party provider should be integrated through an adapter so the Vossie order still has a unified status view.
