

EduHackers 2.0 Decision Session — Consolidated Record

Purpose

This is the decision-oriented reconstruction of the long EduHackers 2.0 working session in which the current Vossie product policy was refined.

Money model

The pilot model was locked as a working hypothesis:

- Seller commission: **7%** of seller transaction value.
- Courier commission: **5%** of courier earnings.
- No separate buyer percentage commission in the pilot.
- Buyer pays applicable delivery cost by default.
- Seller/courier can choose automatic payout or manual withdrawal.
- Only Available funds can be paid out.

Earnings states:

Pending → Secured → Available → Payout Processing → Paid Out.

Delivery and buyer protection

- QR confirms custody transfer.
- Recipient OTP confirms delivery.
- OTP proves delivery, not product satisfaction.
- OTP delivery starts a **24-hour issue window**.
- A qualifying dispute freezes affected seller funds.
- Seller gets the first opportunity to resolve.
- Unresolved cases escalate to Operations.
- Courier earnings are not automatically frozen for a product-quality complaint if OTP-confirmed delivery was successfully completed.

Returns

Responsibility determines cost:

- Seller fault → seller pays.
- Buyer change-of-mind/buyer fault where allowed → buyer pays.
- Hub/courier fault → logistics incident; buyer and seller should not be charged as though either caused it.
- Unclear responsibility → Operations decision.

Authentication

The group rejected student-number/email-format validation as sufficient identity proof.

Production target:

Continue with Eduvos → Microsoft/Entra → existing Authenticator/MFA → signed identity response → active-student verification → Vossie session.

Prototype target:

Simulate the exact institutional flow clearly as sandbox/demo authentication. Do not imply a live Eduvos integration exists before formal approval.

No Vossie-specific Face ID/passkey requirement was retained for the prototype.

Cross-campus transfer

A hybrid model was locked:

- Prefer pooled hub-to-hub movement when route volume justifies it.
- Route through nearest **viable** campuses, not merely nearest coordinates.

- Every leg uses manifests and QR custody.
- Buyer sees one continuous shipment journey.
- Offer a third-party courier alternative when hub pooling is inefficient or too slow.
- Long-distance transfer eligibility is not automatically granted to ordinary local student couriers.

Buyer Requests

Requests became a first-class marketplace capability:

Buyer chooses category, describes need, adds timing/campus/budget and optional media → eligible sellers are notified → sellers respond with offers → buyer accepts one → request converts into normal order/booking flow.

The product avoids a blind auction race. Offers are structured and comparable.

Two-app structure

App 1 — Marketplace

Buyer, Seller, Courier.

App 2 — Operations/business side

Campus Hub, Transfers, Seller Studio where relevant, Incubation and Platform Operations/Admin.

Operations is permissioned, not a universal super-admin experience.

Seller Studio and timetable

Student sellers can upload a timetable PDF or add availability manually. The system extracts class times for convenience, then the student confirms/edits availability before it becomes authoritative. The original timetable need not be retained longer than required for the workflow.

Inventory

Top-level categories were kept deliberately limited and expanded with subcategories/attributes:

- Food & Drinks
- Essentials
- Fashion & Lifestyle
- Services
- Rentals
- Digital
- feature-gated future categories

Category-specific schemas reveal only relevant fields.

Digital inventory

Potential categories include notes, study guides, templates and other legitimate digital products. Past exams or institutional material require stronger ownership/integrity moderation rather than being automatically accepted.

Listing assets

Sellers fill structured fields; Vossie renders consistent buyer-facing cards/pages. Typical buyer presentation includes image/video, title, seller, price, promotion/special state, description, variants/attributes and category-specific transaction controls.

Marketplace Reels

Reels were locked as a commerce-discovery tab:

- 15–30 second seller video.
- Vertical swipe feed.
- Linked seller identity.

- Caption.
- Pinned product/service rail.
- Direct product/cart action.
- Seller analytics for views/taps/orders.
- Reporting/moderation.
- No need to become a generic social network.

Food trust/compliance

Any Seller can use the Food category; food is not a separate account type. Vossie adds food-specific fields, seller responsibility, ingredients/allergens, preparation information, food reviews and incident/reporting paths. The platform should not rely on “buy at your own risk” as its main legal/trust model.

Communications

One transaction/event timeline drives notifications. Key milestones create in-app/push/email events. Receipts remain accessible under Orders. Critical transactional communications are not treated as marketing preferences.

Prototype integrations

Prototype and production are separated:

- Maps/GPS: real UI and simulated movement in prototype; approved provider/live device location in production.
- Payments: sandbox/provider adapter in prototype; approved PSP with live merchant credentials in production.
- Identity: simulated institutional flow in prototype; approved Eduvos/Microsoft federation in production.
- Notifications: demo/sandbox delivery in prototype; production provider later.
