

Team and Pitch History

Confirmed team roles

- **Oratile Modise** — UI/UX Designer
- **Babalo Kali** — Developer and Research Lead
- **Malindi Mpumelelo** — Product Lead
- **Danny Mohale** — Project Manager and Pitch Lead
- **Babalo Kali + Danny Mohale** — Business Analysis and Marketing Leads

Cinematic pitch structure

The pitch was deliberately split into two modes.

Act I — cinematic introduction

The first approximately four minutes introduce the problem, Vossie concept and team contributions without fully demonstrating the application.

Opening concept:

1. Black screen.
2. A single Vossie dot appears.
3. Dot bounces with controlled impact/audio rhythm.
4. Final landing becomes the dot above the **i** in the Vossie wordmark.
5. Camera pushes through the dot into an illustrated campus world.
6. Fragmented student needs/supply are visualized.
7. Team contributions transform the problem into product, design, engineering and coordinated execution.

Team visualization

- Malindi: fragmented needs become a coherent Buyer/Seller/Courier/Operations product system.
- Oratile: product model becomes wireframes, tokens, components and refined responsive UI.
- Babalo: research becomes architecture, code, agents, tests, GitHub and deployment.
- Danny: parallel workstreams converge into project milestones and release readiness.
- Babalo + Danny: business signals become market analysis, positioning and launch thinking.

Pitch handoff

The cinematic layer collapses into the Vossie dot and introduces **Danny Mohale — Pitch Lead**.

Act II — live/cueable product demonstration

Danny receives approximately 15–20 minutes. Vossie itself becomes the presentation rather than relying on static slides.

Cueable chapters include:

- Reveal
- Buyer
- Reels
- Checkout
- Request Marketplace
- Seller
- Courier
- Cross-campus
- Operations
- Incubation
- Recap
- Finale

Each critical live path should have deterministic demo data, a reset route and a prerecorded fallback.
